

Biomarker Changes After a Running Bout Among Individuals with a History of Acute Knee Injury

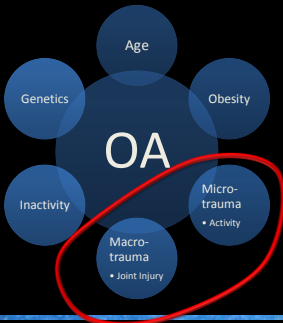

Nicole M. Cattano, PhD, MPH, LAT, ATC
West Chester University of Pennsylvania
Department of Sports Medicine
ATOAC Meeting
June 2015

Disclosures

- Cattano NM, Driban JB, Barbe MF, Tierney R, Amin M, & Sitler MR
- No authors have professional or financial affiliations that would bias this work.

Knee Osteoarthritis Risk Factors

- Increased knee osteoarthritis (OA) prevalence rates

- Muthuri et al., 2011; Frobell et al., 2013; Lohmander et al., 2004; Buckland-Wright et al., 2000; Harris et al, 2013; Driban et al., 2014

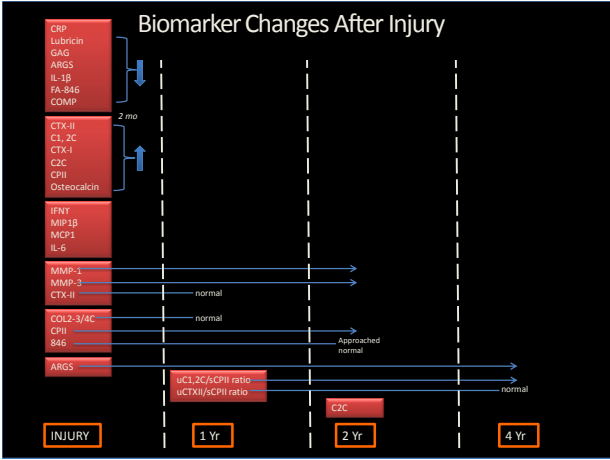

Prevalence Rates

- Sports Participation
- Knee Injury History

Driban et al., 2014; Roos et al., 2004;

Driban et al., 2014; Roos et al., 2004; Deacon et al., 2006; Murphy et al., 2008;

COMP and Walking

- **Cartilage Oligomeric Matrix Protein (COMP)**
 - Significantly increased post exercise
 - 30 min walking in OA and healthy populations
 - Not significant increase post exercise
 - 30 min walking in OA population
 - Change pre to 3.5 h post walk
 - Predictive of cartilage loss

Abramson & Krasnokutsky, 2006; Kersting et al., 2005; Mundermann et al., 2009; Subburaj et al., 2010; Erhart-Hledik et al., 2012;

Cartilage Oligomeric Matrix Protein (COMP) Response to Activity

- Walking
- Running → Dose dependent response
 - 30 min running at self-selected pace
 - 30 min running at 2.2 m/s pace
 - 1 hr running at self-selected pace
 - Marathon running

Niehoff et al. 2010; Niehoff et al. 2011; Kersting et al. 2005; Neidhart et al. 2000

Problem Statement

- Biochemical response has been studied in a healthy and OA population, but not in a younger physically active population including a possible knee injury history motivated to return to activity.
- The relationships between patient reported outcomes and biochemical response to activity is unknown

Purpose Statement

- Determine biomarker concentrations pre exercise and change pre to post exercise in AKIH participants in comparison to healthy control participants.
- Determine if self-perceived pre exercise functional differences existed between groups, and whether these measures correlated with biomarker concentration changes

Participants / Design

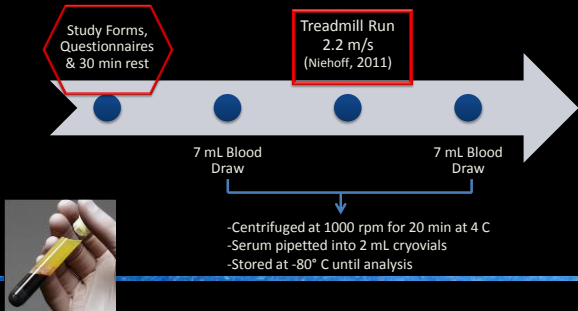

- 2 group pre-test/post-test (n = 22)
 - Independent variable
 - Group
 - Injured (n = 11)
 - Control (n = 11)
 - Matched by gender (same), age (± 2 y), mass (± 6 kg), height (± 5 cm), sport/physical activity impact level (same)

Potential covariates: concurrent injury, time since injury, time since surgery, time since return to activity, gender, smoking, medication/supplement use.

Primary Outcomes

- Dependent Variables
 - Biomarker concentrations
 - COMP
 - CTX-II, CPII, MMP-13, IL-1 β , CTX-II/CPII ratios
 - Tegner Activity Score
 - Knee Osteoarthritis Outcome Score (KOOS)
 - 5 subscales

Procedures

Biomarker Analyses

- All samples stored at -80°C until data collection completed
- Samples were transported to Temple University for ELISA analyses
 - COMP, CTX-II : MyBioSource
 - IL-1β, MMP-13 : Abcam Inc.
 - CPII : IBEX Pharmaceuticals

Data Analyses

- Multiple Wilcoxon Signed Rank Tests
 - Serum biomarker changes pre to post exercise
 - Serum biomarker concentrations pre exercise
 - Pre-exercise functional outcome measures
- Multiple Spearman’s Correlations
 - Pre-exercise functional outcome measures and serum biomarker concentration changes
- Statistical significance defined as $p \leq 0.05$

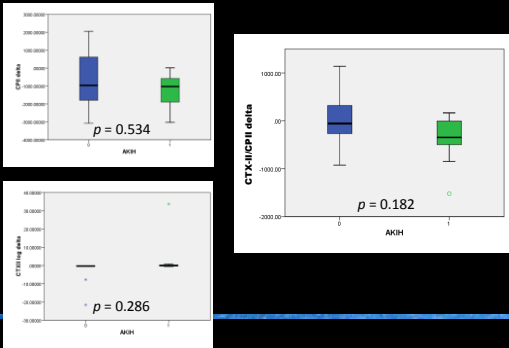

Results: Descriptive Statistics

Variable	AKIH (n = 11)	Control (n = 11)	t	p
Gender	5F/6M	5F/6M	-	-
Age (years)	20.09 ± 1.04	19.91 ± 1.64	-0.310	0.760
Height (m)	1.74 ± 0.13	1.73 ± 0.11	-0.094	0.926
Mass (kg)	74.38 ± 13.98	73.35 ± 14.42	-0.171	0.866
BMI (kg/m²)	24.45 ± 2.83	24.19 ± 2.83	-0.214	0.833
Tegner	6.91 ± 1.51	6.91 ± 1.76	0.000	1.000

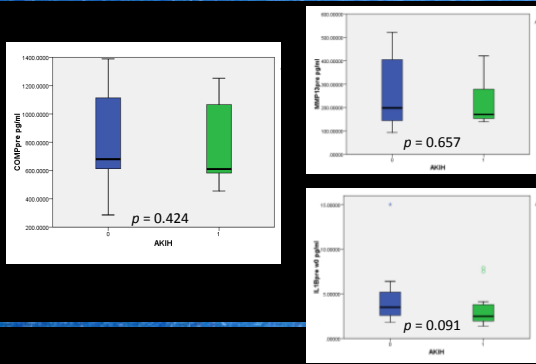

Biomarker Changes Pre to Post Exercise

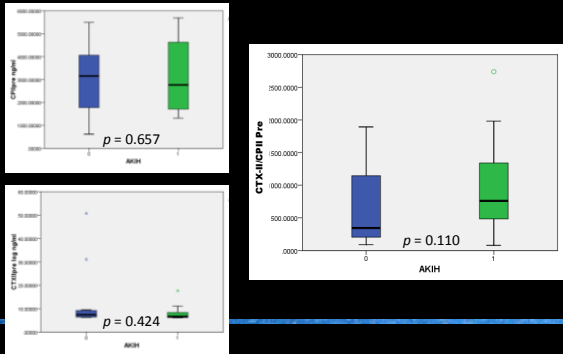

Biomarker Changes Pre to Post Exercise

Baseline Biomarker Comparisons

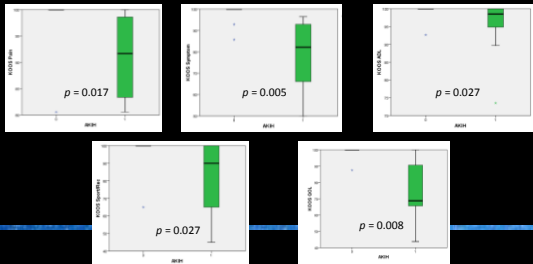

Baseline Biomarker Comparisons

Results: Symptomatic & Functional Differences

- Injured participants had significantly lower KOOS scores in all subscales than healthy controls.

Results: Patient Reported Outcomes Correlated with Biomarker Changes

Measures	COMP	CPII	MMP-13	CTX-II	IL-1 β	CTX-II/CPII
Tegner	-0.20	0.36	0.01	-0.11	-0.13	-0.45*
KOOS Pain	-0.03	0.19	0.06	-0.19	-0.36	-0.03
KOOS Symptoms	0.01	0.13	0.05	-0.23	-0.34	-0.07
KOOS Activities of Daily Living	0.07	0.15	-0.03	-0.15	-0.39	-0.01
KOOS Sport & Recreation	0.07	0.24	0.10	-0.26	-0.24	-0.08
KOOS Quality of Life	-0.07	0.22	-0.10	-0.21	-0.50*	-0.12

Key Findings

- Biochemical response was similar between groups
- Significant functional and symptomatic differences between groups
- Current activity level related to changes in collagen degradation:synthesis ratios
- Decreased quality of life related to increases in IL-1 β after running

Primary : COMP Response

- COMP changes not significantly different
 - AKIH group (median increase 9.6 pg/mL)
 - Control group (median decrease 283.92 pg/mL)

Insignificant Trend:
Erhart-Hledik et al. 2012

No Group Differences:
Mundermann et al. 2006

Significant COMP:
Mundermann et al. 2006
Subburaj et al. 2019

- Unable to distinguish biomarker concentration differences between groups
 - High biomarker variability
 - Exercise intensity

Exploratory Biomarker Responses

CPII

- Two times greater CPII decreases in injured participants than in control participants

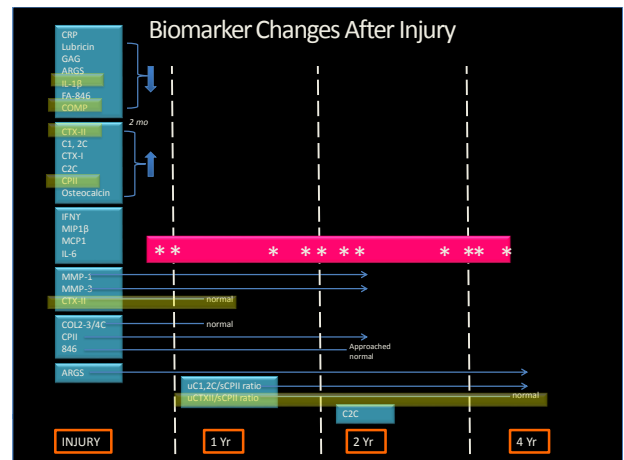

IL-1 β

- Increased in injured participants
- Decreased in control participants

- No statistically significant differences between groups despite previous findings.
- AKIH participants
 - Average = 2 years (range of 4 to 44 months) after injury
- Large variability

- Injury history participants are still trying to participate in similar activities despite reporting pain and symptoms that affect their function and quality of life
- Functional differences may be precursors
 - Activity modifications
 - Underlying biomarker abnormalities
 - Disease onset/progression

- IL-1 β & KOOS Quality of Life
 - Lower KOOS quality of life scores had greater increases in IL-1 β
 - Evidence of association between negative emotional states and increased systemic inflammation
 - Potential targets for intervention efforts

Johnston & Webster, 2009; Al-Shatti et al., 2005; Elliott et al., 2008

Biomarker Changes & Functional Correlations

- Lower activity levels had greater increases in collagen turnover ratios
 - Shift towards more degradation than synthesis
- Reinforces dose-dependent response

Limitations

- Standardized exercise intensity level
- Restricted biomarker panel
- Sample size

Conclusions

- Participants with a knee injury history respond similar to matched healthy controls after a run.
- Participants with a knee injury history have overall lower outcome scores.
- Pre-exercise outcome scores relate to biomarker responses.

Questions?

Thank you

Turner Activity Level Scale

Please indicate in the spaces below your HIGHEST level of activity that you participated in BEFORE YOUR INJURY, the highest level you were able to participate in FOLLOWING SURGERY, if applicable, and the highest level you are able to participate in CURRENTLY.

BEFORE INJURY: AFTER: CURRENTLY:

- Level 10 Competitive sports- soccer, football, rugby (national elite)
- Level 9 Competitive sports- soccer, football, rugby (lower divisions), ice hockey, wrestling, gymnastics, basketball
- Level 8 Competitive sports- racquetball or handy, squash or badminton, track and field athletics (jumping, etc.), down-hill skiing
- Level 7 Competitive sports- tennis, running, snowcross speedway, basketball
- Recreational sports- soccer, football, rugby, handy, ice hockey, basketball, squash, racquetball, running
- Level 6 Recreational sports- tennis and badminton, handball, racquetball, down-hill skiing, jogging at least 5 times per week
- Level 5 Work- heavy labor (construction, etc.)
- Competitive sports- cycling, cross-country skiing
- Recreational sports- jogging in uneven ground at least twice weekly
- Level 4 Work- moderately heavy labor (e.g. truck driving, etc.)
- Level 3 Work- light labor (moving, etc.)
- Level 2 Work- light labor
- Walking on uneven ground possible, but impossible to back pack or hike
- Level 1 Work- sedentary (secretarial, etc.)
- Level 0 Sick leave or disability pension because of knee problems

Turner, V., Lydenius, J. Rating system in the evaluation of knee ligament injuries. Clin Orthop 199; 43-46, 1985.

Level 10	Competitive sports- soccer, football, rugby (national elite)
Level 9	Competitive sports- soccer, football, rugby (lower divisions), ice hockey, wrestling, gymnastics, basketball
Level 8	Competitive sports- racquetball or bandy, squash or badminton, track and field athletics (jumping, etc.), down-hill skiing
Level 7	Competitive sports- tennis, running, motorcars speedway, handball Recreational sports- soccer, football, rugby, bandy, ice hockey, basketball, squash, racquetball, running
Level 6	Recreational sports- tennis and badminton, handball, racquetball, down-hill skiing, jogging at least 5 times per week
Level 5	Work- heavy labor (construction, etc.) Competitive sports- cycling, cross-country skiing, Recreational sports- jogging on uneven ground at least twice weekly
